PROFESSIONAL SUMMARY

Full-stack engineer with backend depth and **10+ years** of experience building and operating production systems across e-commerce, SaaS, enterprise, and retail. Hands-on Java in every role, from Java desktop utilities and Play Framework middleware to Spring Boot and RESTEasy microservices on Java 6, 8, and 11, alongside NestJS/Node.js, event-driven architecture on Google Cloud, and Commercetools integrations. Also ships the UI: React on the checkout and Next.js on internal tooling. Designs systems from the problem up, then proposes them, writes the technical design, implements, tests, releases, and supports them in production with no day-to-day supervision. Uses AI coding tools daily, with strict verification and security guardrails.

EXPERIENCE

Backend Engineer — Pet Circle

Jun 2022 – Oct 2026

Australian e-commerce: pet food, supplies, health & insurance · Capacity team · Remote from Cebu, Philippines

- Capacity team member responsible for the **delivery promise at checkout** and the warehouse systems behind it: order lifecycle, capacity, courier, stock, and logistics through to delivery. Own features end to end with no supervision.
- Maintain and extend **Spring Boot and RESTEasy (JAX-RS)** microservices across **Java 6, 8, and 11**, including JSF-based applications, integrated with **Commercetools**.
- Work across the checkout stack, with **Spring Boot APIs** and a **React** UI, carrying API contract changes through both the existing APIs and the UI.
- **Fulfilment Capacity Redesign (designed & led)**: extended the capacity check from courier-only daily capacity to **warehouse-level daily capacity** plus working-day rules (public holidays, recurring and ad hoc non-working days). Authored the technical design (dual capacity model, forecasting, audit trail, datetime-level granularity for delivery time slots), making the checkout delivery promise close to 100% accurate.
- **ATLAS Fulfilment Capacity page**: proposed and built the page in the internal warehouse app (**Next.js** front end, new Next.js APIs alongside existing Spring Boot APIs) so warehouses can maintain capacity by date range or date and manage non-working days.
- **courier-event-comms**: event-driven **NestJS Cloud Run function** that consumes same-day courier on-board events, fetches order details from the order API, and publishes to a Pub/Sub topic consumed by **Braze** for customer SMS and email notifications.
- **delivery-code-update**: NestJS Cloud Run function that syncs delivery-code changes published by Minpin, the legacy JSP/JSF warehouse app being migrated to ATLAS, into Commercetools. This keeps the delivery promise and delivery-code-based discounts accurate.
- **Delivery Feedback MCP**: MCP server called by **Gladly AI** that captures non-serious delivery feedback for orders delivered within 30 days, posts it to **Nash** (courier platform) for delivery and driver performance review, and publishes it via Pub/Sub to **BigQuery**, which replaced CX spreadsheets with queryable metrics.
- Implemented Commercetools customer search over **GraphQL** against custom fields to support operational lookups.

Full Stack Developer — Fujitsu Global IT Services and Solutions

Feb 2021 – May 2022

KOPT team · Japanese enterprise client · Cebu City, Philippines

- Maintained the application of a **Japanese electric power company**, developing frontend and backend features and bug fixes on **Java 6** and Fujitsu's **X33 framework** (JSP).
- Translated Japanese business requirements into technical specifications, then owned implementation and testing before handing off to the Japan team for review and deployment in a documentation-heavy Waterfall process.
- Wrote and maintained **JUnit** test coverage, and wrote and tuned **Oracle** queries for features and defect investigation.

Full Stack Web Developer — Cazoomi

Jan 2018 – Dec 2020

San Francisco, California · Remote

- Built integrations for **SyncApps**, a SaaS middleware syncing CRMs (Salesforce, NetSuite, Zoho CRM, Microsoft Dynamics) with email service providers (Mailchimp, Constant Contact, HubSpot, ActiveCampaign), letting CRMs without email features run campaigns.
- Developed backend sync services on **Java 6** and the **Play Framework** against third-party CRM and ESP APIs, and the web app front end in HTML, CSS, JavaScript, and Bootstrap.
- Delivered client customizations and new features according to each client's subscription level, making integrations smooth and fast on both ends.
- Worked with **ArangoDB** (sign-up and subscription data) and **PostgreSQL**; cached reused objects in **Memcached** using a cache-aside pattern with TTL expiry and invalidation on update.
- Handled escalated technical support, diagnosing integration and sync failures for customers.

- **Designed and built POS utilities that automatically fix stuck data:** identified the recurring problem, designed the solution, proposed it to tech leads, and implemented it through to production.
- Retrieved per-store sales reports directly from store databases with SQL scripts, and wrote the procedural SQL behind materialized views used by the Jewelry department.
- Supported Oracle Retail modules (RMS, ORPOS, OReSA, GL) and built **Java desktop utilities** for Sales Audit and POS operations.
- Built a **PHP** web app for viewing sales data, and automated store operations with **Bash and Korn shell** scripts.

AI-ASSISTED ENGINEERING

- Use **Claude Code, Cursor, and Gemini** daily, plus **ElevenLabs and Remotion** in side projects. Each project is set up with its own conventions and context, reusable Skills, and a custom MCP server.
- Use AI for boilerplate, debugging, test generation, code and design review, and analysis of unfamiliar code.
- **Verify every output** against real schemas and docs. During a Commercetools integration I caught AI-invented field and object names before they shipped.
- Never share credentials or secrets with AI tools. I own the implementation, which is driven by the business rules rather than the model.

SIDE PROJECTS

- Indie developer shipping mobile and web products for the Philippine market with Expo/React Native, NestJS on Cloud Run, and PostgreSQL/Supabase, with GCash and PayMongo payment rails. Products: **Serenity** (mental wellness app with Claude-powered journaling), **Kabisado** (Civil Service Exam reviewer), a **pickleball court booking app**, **PickleQueue** (pickleball matchmaking), **Job Scout** (AI job scraper with Gemini), and **Kiko's World** (AI video pipeline with Gemini, ElevenLabs, and Remotion).
- Freelance engagement migrating a dental clinic application from AWS EC2/MongoDB to Supabase, Vercel, and React, including the phased migration plan.

TECHNICAL SKILLS

Languages	Java (6, 8, 11), TypeScript, JavaScript, SQL and Procedural SQL, PHP, Python, Bash / Korn shell
Java	Spring Boot, REStEasy (JAX-RS), JSF, Play Framework, X33 framework, JUnit, Java desktop applications
Backend	NestJS, Node.js, Next.js API routes, REST and GraphQL API design, event-driven and pub/sub architecture, microservices
Frontend	React, Next.js, React Native / Expo, HTML, CSS, Bootstrap
Cloud & DevOps	GCP (Cloud Run, Cloud Run functions, Pub/Sub, BigQuery), Supabase, Vercel, Docker, Git, Nx monorepos
Databases	PostgreSQL, MySQL, Oracle, MongoDB, ArangoDB, Memcached
Platforms	Commercetools, Braze, Gladly, Nash, Oracle Retail (RMS, ORPOS, OReSA, GL)
AI Tooling	Claude Code, Cursor, Gemini API, Claude API, ElevenLabs, Remotion, MCP server development, Skills authoring
Strengths	System and technical design, database structure and performance optimisation, API design, autonomous end-to-end ownership, clear written and verbal communication

EDUCATION

LANGUAGES

Filipino (native) · English (professional working proficiency)
